## Task: To-Do List Web Application using JavaScript

### Overview

This is a simple, web-based **To-Do List application**. It allows users to manage their daily tasks by adding new items to a list and deleting them once they are finished. The application is built using basic web technologies: HTML, CSS, and JavaScript.

### Features

- **Add Tasks:** Users can type a task into the input box and click the "Add" button to put it on the list.
- **Empty Input Check:** If a user tries to click "Add" without typing anything, the app shows an alert message asking them to enter a task.
- **Delete Tasks:** Each task has its own "Delete" button. Clicking it removes that specific task from the list immediately.
- **Clear Input:** After adding a task, the input box automatically clears out so the user can easily type the next one.

### Technologies Used

- **HTML:** Used to create the structure of the page (heading, input box, button, and list).
- **CSS:** Used to style the page, align the text to the center, add spacing (padding/margins), and change the font style.
- **JavaScript:** Used to make the page interactive (handling the logic for adding and removing tasks).

## Conclusion

It handles user input, updates the webpage dynamically without reloading, and provides a clean interface for managing everyday tasks.
